Решаем уравнение
$$\frac{\partial T}{\partial t} + u \frac{\partial T}{\partial x} - \chi \frac{\partial^2 T}{\partial x^2} = 0$$

Используем явную разностную схему против потока

$$1 - 4 \cdot (1 - s - 2r)(s + 2r) \cdot \sin^2(\frac{\alpha}{2}) - 4r(r + s) \cdot \sin^2(\alpha) < 1$$

$$4 \cdot (1 - s - 2r)(s + 2r) \cdot \sin^2(\frac{\alpha}{2}) + 4r(r + s) \cdot \sin^2(\alpha) > 0$$

$$r(r + s) \cdot \sin^2(\alpha) > (s + 2r - 1)(s + 2r) \cdot \sin^2(\frac{\alpha}{2})$$

Докажем, что ответом является s+2r<0

1. Достаточность

Пусть s+2r<0. Тогда $\forall \alpha: (s+2r-1)(s+2r)\cdot sin^2(\frac{\alpha}{2})<0$. Заметим также, что $\forall r,s,\alpha: r(r+s)\cdot sin^2(\alpha)\geq 0$.

Поэтому
$$s+2r<0 \Rightarrow \forall \alpha: r(r+s)\cdot sin^2(\alpha)>(s+2r-1)(s+2r)\cdot sin^2(\frac{\alpha}{2})$$

2. Необходтмость

Пусть $s+2r \geq 0$. Тогда рассмотрим $\alpha=\pi$. Тогда $r(r+s) \cdot sin^2(\alpha) = r(r+s) \cdot sin^2(\pi) = 0$, а $(s+2r-1)(s+2r) \cdot sin^2(\frac{\alpha}{2}) = (s+2r-1)(s+2r) \cdot sin^2(\frac{\pi}{2}) = (s+2r-1)(s+2r) \geq 0$.

То есть
$$\exists \alpha = \pi : r(r+s) \cdot sin^2(\alpha) \leq (s+2r-1)(s+2r) \cdot sin^2(\frac{\alpha}{2})$$
